

Adding OpenMP to Your Code Using Cray Reveal

Helen He
NERSC User Services Group

October 10, 2013

Current Architecture Trend

- Multi-socket nodes with rapidly increasing core counts
- Memory per core decreases
- Memory bandwidth per core decreases
- Network bandwidth per core decreases
- Need a hybrid programming model with three levels of parallelism
 - MPI between nodes or sockets
 - Shared memory (such as OpenMP) on the nodes/sockets
 - Increase vectorization for lower level loop structures

Advantages of hybrid MPI/OpenMP

- Reduce number of MPI ranks per node
- Minimize network injection contention
- Avoids the extra communication overhead with MPI within node
- Reduce memory footprint
- Chance of overlapping MPI communication with OpenMP thread computation

What is Reveal

- A tool developed by Cray to help developing the hybrid programming model
- Part of the Cray Perftools software package
- Only works under PrgEnv-cray
- Utilizes the Cray CCE program library for loopmark and source code analysis, combined with performance data collected from CrayPat
- Helps to identify top time consuming loops, with compiler feedback on dependency and vectorization
- Loop scope analysis provides variable scope and compiler directive suggestions for inserting OpenMP parallelism to a serial or pure MPI code

Steps to Use Reveal on Edison (1)

- **Load the user environment**
 - % module swap PrgEnv-intel PrgEnv-cray
 - % module unload darshan
 - % module load perftools (current default is version 6.1.2)
- **Generate loop work estimates**
 - % ftn -c -h profile_generate myprogram.f90
 - % ftn -o poisson_serial -h profile_generate myprogram.o
 - Good to separate compile and link to keep object files
 - Optimization flags disabled with -h profile-generate
 - % pat_build -w myprogram (-w enables tracing)
 - It will generate executable “myprogram+pat”
 - Run the program “myprogram+pat”
 - It will generate one or more myprogram+pat+...xf files
 - % pat_report myprogram+pat...xf > myprogram.rpt
 - It will generate myprogram+pat....ap2 file

Steps to Use Reveal on Edison (2)

- **Generate a program library**
 - % ftn -O3 -hpl=myprogram.pl -c myprogram.f90
 - Optimization flags can be used
 - Build one source code at a time, with “-c” flag
 - Use absolute path for program library if sources are in multiple directories
 - User needs to clean up program library from time to time
- **Launch Reveal**
 - % reveal myprogram.pl myprogram+pat...ap2

Steps to Use Reveal on Hopper

- To use the newest version **perftools/6.1.2**, which is built upon **cray-mpich/6.x.x**
 - % module unload cray-libsci cray-mpich2
 - % module load cray-libsci/12.1.01
 - % module load cray-mpich/6.1.0
 - % module unload darshan
 - % module load perftools-lite/6.1.2
- To use **perftools-lite/6.1.1 or older**
 - % module unload darshan
 - % module load perftools-lite/6.1.2
- Follow the rest of steps for Edison

Top loops with compiler loopmarks and feedback

The screenshot shows a software interface for analyzing compiler loopmarks and feedback. On the left, a navigation pane titled "Top Loops" lists various functions and their loops, with a red box highlighting the "Top loops" entry. In the center, the source code for `poisson_mpi.c` is displayed, with lines 159 through 181 shown. A callout box labeled "Compiler loopmarks" points to the first few lines of the loop. The code includes MPI_Allreduce calls and conditional logic. A callout box labeled "Compiler feedback" points to the "Info - Line 161" section at the bottom, which contains a message about a loop not being vectorized due to a recurrence. The interface has standard menu bars (File, Edit, View, Help) and toolbars with buttons for Up, Down, Save, and other operations.

```

Info - Line 161
A loop was not vectorized because a recurrence was found between "u_new" and "my_change" at line 167.

Compiler feedback explanation

The screenshot shows a software interface for compiler feedback. On the left is a navigation tree titled "Top Loops" under "poisson_mpi.c". The tree lists several loops with their execution times and loop numbers:

- poisson_mpi.c: 0.0055 Loop@252, 0.0055 Loop@258
- jacobi: 9.4596 Loop@325, 9.4094 Loop@327, 0.0479 Loop@343, 0.0370 Loop@354
- main: 33.5342 Loop@148, 23.5715 Loop@161, 23.5289 Loop@163
- make_domains: 0.0000 Loop@404
- make_source: 0.0056 Loop@495
- timestamp

The "23.5289 Loop@163" node is selected. The main window displays the source code for this loop:

```
L 161 for ( i = i_min[my_rank]; i <= i_max[my_rank]; i++ )  
Lr4 162 {  
Lr4 163   for ( j = 1; j <= N; j++ )  
Lr4 164   {  
...  
182 }  
183 if ( my_rank == 0 && ( step % 1000 ) == 0 )
```

An "Explain" dialog box is open over the code, explaining why the loop was not vectorized:

VECTOR: A loop was not vectorized because a recurrence was found between "var" and "var" at line num.

Scalar code was generated for the loop because it contains a linear recurrence. The following loop would cause this message to be issued:

```
for (i = 1; i < 100; i++) {  
    b[i] = a[i-1];  
    a[i] = b[i];  
}
```

Below the dialog, the "Info" panel shows:

A loop was not vectorized because a recurrence was found between "u_new" and "my_change" at line 167.
A loop was unrolled 4 times.

A red callout box with the text "Double click to explain" points to the "Info" panel.

```

Info - Line 163

- A loop was not vectorized because a recurrence was found between "u_new" and "my_change" at line 167.
- A loop was unrolled 4 times.

Explain CC-6005

SCALAR: A loop was unrolled.

The compiler unrolled the loop. Unrolling creates a number of copies of the loop body. When unrolling an outer loop, the compiler attempts to fuse replicated inner loops - a transformation known as unroll-and-jam. The compiler will always employ the unroll-and-jam mode when unrolling an outer loop; literal outer loop unrolling may occur when unrolling to satisfy a user directive (pragma).

This message indicates that unroll-and-jam was performed with respect to the identified loop. A different message is issued when literal outer loop unrolling is performed, as this transformation is far less likely to be beneficial.

For sake of illustration, the following contrasts unroll-and-jam with literal outer loop unrolling.

```

for (j=0; j<10; i++) {
  for (i=0; i<100; i++) {
    a[i][i] = b[i][i] + 42.0;
  }
}

for (j=0; i<10; i+=2) {
  for (i=0; i<100; i++) {
    a[j][i] = b[j][i] + 42.0;
    a[j+1][i] = b[j+1][i] + 42.0;
  }
}

for (j=0; i<10; i+=2) {
  for (i=0; i<100; i++) {
    a[j][i] = b[j][i] + 42.0;
  }
  for (i=0; i<100; i++) {
    a[j+1][i] = b[j+1][i] + 42.0;
  }
}

```

The literal outer unroll code performs the same sequence of memory operations as the original nest, while the unroll-and-jam transformation interleaves operations from outer loop iterations. The compiler employs literal outerloop unrolling only when the data dependencies in the loop, or a control flow impediment, prevent fusion of the replicated inner loops. Literal outer

Reveal scoping assistance

The screenshot shows two windows of the Reveal IDE. The left window displays the source code for `poisson_mpi.c`, specifically line 161 which contains a nested loop. A callout box with the text "Right click to select loops" points to the line 161 code. The right window shows the "Reveal OpenMP Scoping" dialog with the "Scope Loops" tab selected, listing the loops selected for scoping (lines 161 and 163). A callout box with the text "Start Scoping" points to the "Start Scoping" button in the dialog.

Reduction in an inlined function

There is a reduction to a variable which is in a called function. The OMP programming model does not provide any method for automatically protecting the reduction variable. For the loop to run correctly, the user needs to protect this reduction with a lock or change it to an atomic operation.

Note:

Because of current limitations in the analysis, if a global variable is inlined anywhere into the calling function, it must assume there is an inlined reference in any loop which has any reference to the variable. As a consequence of this, Reveal may display this scoping problem when it does not really exist.

Note:

Since the addition of a lock or changing to an atomic operation may significantly decrease performance, it may be necessary to clone the function containing the reduction if it is called from other places where the protection is unnecessary.

Reveal - Extended Help

Program Library

loop or loops to scope. To do this, right-click it a candidate for scoping. Starting the scoping. A new window titled "Reveal OpenMP Scoping" will appear at the bottom left of the "Scope Loops" tab of the Scoping window. Files listed in the navigation panel will have a red or green icon added when they contain scoping information.

Create OpenMP clauses or directives

View scoping information by clicking on loops in the navigation panel that have been marked with a red or green icon. A new window with the title "Reveal OpenMP Scoping" will appear that contains the scoping information. Variables will be scoped shared, private or unresolved. Unresolved variables are identified so that you can focus on addressing conflicts or issues that prevent correct parallel execution. Reduction variables are highlighted with a red 'R' superscript and inlined variables that caused an error are highlighted with a red 'I' superscript.

Change the scope of a specific variable by clicking on the scope presented for that variable.

Click on a variable in the "Scoping Results" and see highlighted occurrences of that variable within the "Source" panel.

View and Save OpenMP directives

Science

Reveal helps to start adding OpenMP

- Only under PrgEnv-cray, with CCE compiler
- Start from most time consuming loops first
- Insert OpenMP directives
 - Make sure to save a copy of the original code first, since the saved new file will overwrite the original code
- There will be unresolved and incomplete variable scopes
- There maybe more incomplete and incorrect variables identified when compiling the resulted OpenMP codes
- User still needs to understand OpenMP, and resolves the issues.
- Verify correctness and performance
- Repeat as necessary
- No OpenMP tasks, barrier, critical, atomic regions, etc

More work after reveal (1)

Reveal suggests:

```
#pragma omp parallel for default(none)
    unresolved (my_change,my_n)
    shared (my_rank,N,i_max,u_new,u)
    firstprivate (i)

    for ( i = i_min[my_rank]; i <= i_max[my_rank]; i++ )
    {
        for ( j = 1; j <= N; j++ )
        {
            if ( u_new[INDEX(i,j)] != 0.0 )
            {
                my_change = my_change
                    + fabs ( 1.0 - u[INDEX(i,j)] / u_new[INDEX(i,j)] );

                my_n = my_n + 1;
            }
        }
    }
```

Final code:

(Lots of changes from Reveal suggestions, but will still make the code slower than without OpenMP directives, so will not use any directives)

```
#pragma omp parallel for default(none)
    private (my_change,my_n)
    shared (my_rank,N,i_min,i_max,u_new,u)
    private (j)
    private (i)

    for ( i = i_min[my_rank]; i <= i_max[my_rank]; i++ )
    {
        for ( j = 1; j <= N; j++ )
        {
            if ( u_new[INDEX(i,j)] != 0.0 )
#pragma omp critical
            {
                my_change = my_change
                    + fabs ( 1.0 - u[INDEX(i,j)] / u_new[INDEX(i,j)] );

                my_n = my_n + 1;
            }
        }
    }
```

More work after Reveal (2)

Reveal suggests:

```
#pragma omp parallel for default(none) \
    shared (f,N,u,u_new,i,h)

for ( i = i_min[my_rank] + 1; i <= i_max[my_rank] - 1; i+
+ )
{
    for ( j = 1; j <= N; j++ )
    {
        u_new[INDEX(i,j)] =
            0.25 * ( u[INDEX(i-1,j)] + u[INDEX(i+1,j)] +
                u[INDEX(i,j-1)] + u[INDEX(i,j+1)] +
                h * h * f[INDEX(i,j)] );
    }
}
```

Final code:

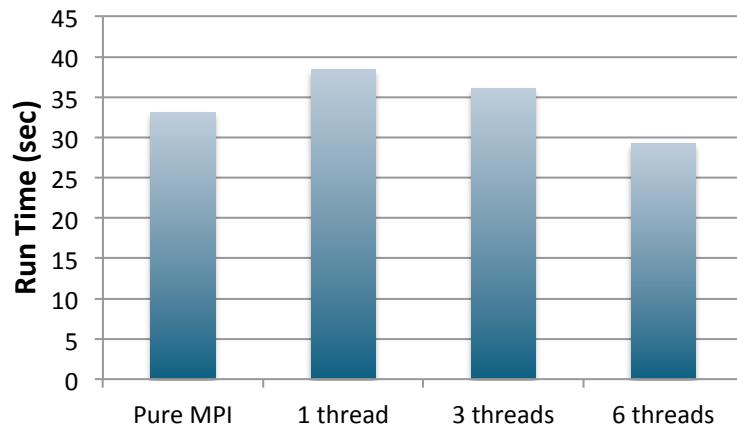

```
#pragma omp parallel for default(none) \
    private (my_rank,j,i) \
    shared (f,N,u,u_new,h,i_min,i_max)

for ( i = i_min[my_rank] + 1; i <= i_max[my_rank] - 1; i++ )
{
    for ( j = 1; j <= N; j++ )
    {
        u_new[INDEX(i,j)] =
            0.25 * ( u[INDEX(i-1,j)] + u[INDEX(i+1,j)] +
                u[INDEX(i,j-1)] + u[INDEX(i,j+1)] +
                h * h * f[INDEX(i,j)] );
    }
}
```

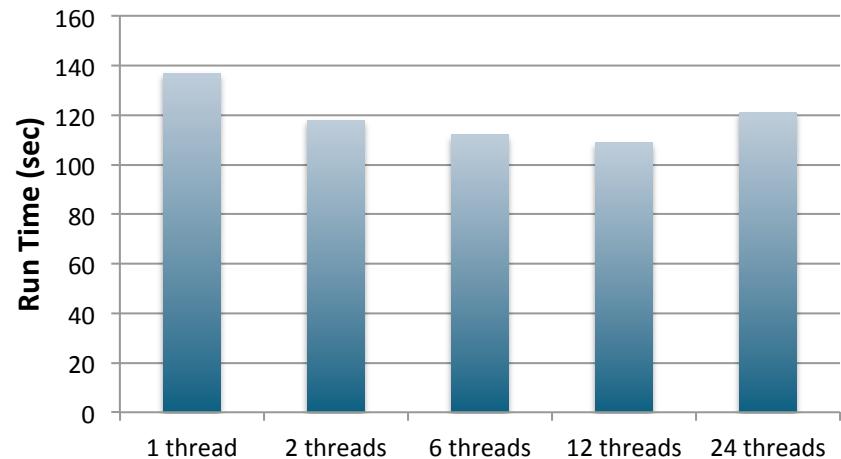

Performance with OpenMP added

**Poisson_mpi_omp, 4 MPI tasks,
N=1200, on Edison**

**poisson_omp
nx=ny=1201, on Edison**
